# Propositional Calculus - Semantics (3/3)

Moonzoo Kim CS Division of EECS Dept. KAIST

moonzoo@cs.kaist.ac.kr http://pswlab.kaist.ac.kr/courses/cs402-07

1

#### **Overview**

- 2.1 Boolean operators
- 2.2 Propositional formulas
- 2.3 Interpretations
- 2.4 Logical Equivalence and substitution
- 2.5 Satisfiability, validity, and consequence
- 2.6 Semantic tableaux
- 2.7 Soundness and completeness

- The method of semantic tableaux is a relatively efficient algorithm for deciding satisfiability in the propositional calculus.
  - Search systematically for a model.
  - If one is found, the formula is satisfiable; otherwise, it is unsatisfiable.
- This method is the main tool for proving general theorems about the calculus.

#### **Definition 2.43**

- A literal is an atom or a negation of an atom.
- An atom is a positive literal and the negation of an atom is a negative literal.
- For any atom p,  $\{p, \neg p\}$  is a complementary pair of literals.
- For any formula A, {A, ¬A} is a complementary pair of formulas.
- A is the complement of  $\neg A$  and  $\neg A$  is the complement of A.

Analyze the satisfiablity of A = p ∧ (¬q ∨ ¬p)
ν (A) = T iff both ν (p) = T and ν (¬q ∨ ¬p) = T.
Hence, ν (A) = T if and only if either:
1. ν (p) = T and ν (¬q) = T or
2. ν (p) = T and ν (¬p) = T
⇒ {p, ¬p} or {p, ¬q}

Reduce the question of the satisfiability of formula *A* to question about the satisfiability of sets of literals. (top-down approach)

- Formula  $B=(p \lor q) \land (\neg p \land \neg q)$ .
- $\nu$  (*B*) = *T* iff  $\nu$  ( $p \lor q$ ) = *T* and  $\nu$ ( $\neg p \land \neg q$ ) = *T*.
- Hence,  $\nu$  (*B*) = *T* iff  $\nu$  ( $p \lor q$ ) =  $\nu$  ( $\neg p$ ) =  $\nu$  ( $\neg q$ ) = *T*.
- Hence,  $\nu$  (B) = T iff either
  - 1.  $\nu(p) = \nu(\neg p) = \nu(\neg q) = T$ , or 2.  $\nu(q) = \nu(\neg p) = \nu(\neg q) = T$ .

Since both { $p, \neg p, \neg q$ } and { $q, \neg p, \neg q$ } contain complementary pairs, B is unsatisfiable.

- The systematic search is easy to conduct if a data structure is used to keep track of the assignments that must be made to subformulas.
- In semantic tableaux, *trees* are used.
- A leaf containing a complementary set of literals will marked ×, while a satisfiable leaf will be marked •.

$$p \land (\neg q \lor \neg p)$$

- $\alpha$ -formulas are conjuctive and are satisfiable only if both subformulas  $\alpha_1$  and  $\alpha_2$  are satisfied
- $\beta$ -formulas are disjuctive and are satisfied even if only one of the subformulas  $\beta_1$  or  $\beta_2$  is satisfiable.

α	$\alpha_1$	α2
$\neg \neg A_1$	$A_1$	
$A_1 \wedge A_2$	$A_1$	A <sub>2</sub>
$\neg (A_1 \lor A_2)$	$\neg A_1$	$\neg A_2$
$\neg \left( A_{1} \rightarrow A_{2} \right)$	$A_1$	$\neg A_2$
$\neg (A_1 \uparrow A_2)$	$A_1$	<i>A</i> <sub>2</sub>
$A_1 \downarrow A_2$	$\neg A_1$	$\neg A_2$
$A_1 \leftrightarrow A_2$	$A_1 \rightarrow A_2$	$A_2 \rightarrow A_1$
$\neg (A_1 \oplus A_2)$	$A_1 \rightarrow A_2$	$A_2 \rightarrow A_1$

β	$\beta_1$	β <sub>2</sub>
$\neg (B_1 \wedge B_2)$	$\neg B_1$	$\neg B_2$
$B_1 \vee B_2$	$B_1$	<i>B</i> <sub>2</sub>
$B_1 \rightarrow B_2$	$\neg B_1$	<i>B</i> <sub>2</sub>
$B_1 \uparrow B_2$	$\neg B_1$	¬ B <sub>2</sub>
$\neg (B_1 \downarrow B_2)$	$B_1$	<i>B</i> <sub>2</sub>
$\neg (B_1 \leftrightarrow B_2)$	$\neg (B_1 \rightarrow B_2)$	$\neg (B_2 \rightarrow B_1)$
$B_1 \oplus B_2$	$\neg (B_1 \rightarrow B_2)$	$\neg \left(B_2 \rightarrow B_1\right)$

Algorithm 2.46 (Construction of a semantic tableau)
 Input: A formula A of the propositional calculus.
 Output: A semantic tableau T for A all of whose leaves are marked.

 $\mathcal{T}$  for A is a tree each node of which will be labeled with a set of formulas U(I): the set of formula of leaf *I*.

The construction terminates when all leaves are marked  $\times$  or  $\odot$  .

- If U(l) is a set of literals, check if there is a complementary pair of literals in U(l). If so, mark the leaf closed ×; if not, mark the leaf as open ⊙.
- If U(l) is not a set of literals, choose a formula in U(l) which is not a literal.
  - If the formula is an  $\alpha$ -formula, create a new node l' as a child of l and label l' with  $U(l') = (U(l) \{\alpha\}) \cup \{\alpha_1, \alpha_2\}$ .
  - If the formula is a β –formula, create two new nodes l' and l" as children of l. Label l' with U(l') = (U(l) {β}) ∪ {β₁}, and label l" with U(l") = (U(l) {β}) ∪ {β₂}.

#### **Definition 2.47**

- A tableau whose construction has terminated is called a completed tableau.
- A completed tableau is closed if all leaves are marked closed (x). Otherwise, it is open.

Theorem 2.48

The construction of a semantic tableau terminates.

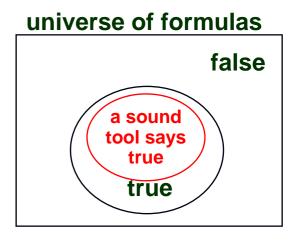

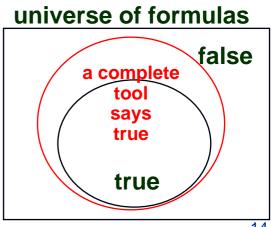

# **Soundness and completeness**

- A tool is sound if the tool says that a formula φ is valid (validity, not satisfiability), then φ is really valid
- A tool is complete if  $\phi$  is valid, then the tool says that  $\phi$  is valid
  - Writing in a counter positive way
    - A tool (or method) is complete if the tool says that φ is not valid, then φ is really not valid
- Therefore, if a tool is sound and complete, then
  - the tool says that  $\phi$  is valid iff  $\phi$  is really valid
- Note that

Intro. to Logic CS402 Fall 2007

- if a dumb tool always says that  $\phi$  is not valid, then that tool is still sound
- if a dumb tool always says that φ is valid, then that tool is still complete

#### **Soundness and completeness**

Theorem 2.49(Soundness and completeness)

- Let  $\mathcal{T}$  be a completed tableau for a formula A. A is unsatisfiable if and only if  $\mathcal{T}$  is closed.
- Corollary 2.50 A is satisfiable if and only if  $\mathcal{T}$  is open.
- Corollary 2.51 A is valid iff the tableau for  $\neg A$  closes.
- Corollary 2.52 The method of semantic tableaux is a decision procedure for validity in the propositional calculus.

#### Soundness

#### Proof of soundness

- if the tableau  $\mathcal{T}$  for a formula A closes, then A is unsatisfiable.
- if a subtree rooted at node n of  $\mathcal{T}$  closes, then the set of formulas U(n) labeling n is unsatisfiable.
  - *h*: height of the node n in  $\mathcal{T}$ .
  - If h = 0, n is a leaf. Since T closes, U(n) contains a complementary set of literals. Hence U(n) is unsatisfiable.

### Soundness

#### If h > 0, then some α - or β – rule was used in creating the child(ren) of n:

• Case 1: An  $\alpha$  -rule was used.  $U(n) = \{A_1 \land A_2\} \cup U_0$  and  $U(n') = \{A_1, A_2\} \cup U_0$  for some set of formulas  $U_0$ . But the height of *n*' is *h*-1, so U(n') is unsatisfiable since the subtree rooted at n' closes. Let  $\nu$  be an arbitrary interpretation. Since U(n') is unsatisfiable,  $\nu(A') = F$  for some  $A' \in U(n')$ . There are three possiblities:

For some 
$$A_0 \in U_0$$
,  $\nu$  ( $A_0$ ) = *F*. But  $A_0 \in U_0 \subseteq U(n)$ .

 $\nu(A_1) = F, \nu(A_1 \land A_2) = F, \text{ and } A_1 \land A_2 \in U(n).$ 

•  $\nu(A_2) = F$ .  $\nu(A_1 \land A_2) = F$ , and  $A_1 \land A_2 \in U(n)$ .

Thus  $\nu$  (*A*) = *F* for some  $A \in U(n)$ ; U(n) is unsatisfiable.

 $n': \{A_1, A_2\} \cup U_0$ 

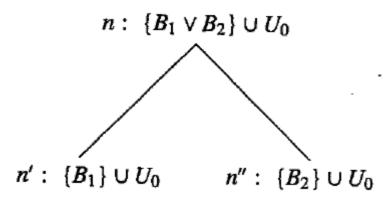

### Soundness

#### Case 2:

A  $\beta$  -rule was used.  $U(n) = \{B_1 \lor B_2\} \cup U_0$ ,  $U(n') = \{B_1\} \cup U_0$ , and  $U(n'') = \{B_2\} \cup U_0$ . By the inductive hypothesis, both U(n') and U(n'') are unsatisfiable. Let  $\nu$  be an arbitrary interpretation. There are two possibilities:

- U(n') and U(n'') are unsatisfiable because  $\nu(B_0) = F$  for some  $B_0 \in U_0$ . But  $B_0 \in U_0 \subseteq U(n)$ .
- Otherwise,  $\nu(B_0) = T$  for all  $B_0 \in U_0$ . Since both U(n') and U(n'') are unsatisfiable,  $\nu(B_1) = \nu(B_2) = F$ . By definition of  $\nu$  on  $\lor$ ,  $\nu(B_1 \lor B_2) = F$ , and  $B_1 \lor B_2 \in U(n)$ .

Thus  $\nu$  (*B*) = *F* for some  $B \in U(n)$ ; since  $\nu$  was arbitrary, U(n) is unsatisfiable.

## **Completeness**

#### **Proof of completeness**

- If A is unsatisfiable then every tableau for A closes.
- Contrapositive statement
  - If some tableau for A is open (i.e., if some tableau for A has an open branch), then the formula A is satisfiable.

# Completeness

#### Definition 2.57

Let U be a set of formulas. U is a Hintikka set iff:

- 1. For all atoms *p* appearing in a formula of *U*, either  $p \notin U$  or  $\neg p \notin U$ .
- 2. If  $\alpha \in U$  is an  $\alpha$ -formula, then  $\alpha_1 \in U$  and  $\alpha_2 \in U$ .
- 3. If  $\beta \in U$  is a  $\beta$  –formula, then  $\beta_1 \in U$  or  $\beta_2 \in U$ .

Theorem 2.59

Let l be an open leaf in a completed tableau  $\mathcal{T}$ .

Let  $U = \bigcup_i U(i)$ , where *i* runs over the set of nodes on the branch from the root to *l*. Then *U* is a Hintikka set.

# Completeness

#### Theorem 2.60(Hintikka's Lemma)

Let U be a Hintikka set. Then U is satisfiable.

#### Proof of completeness:

• Let  $\mathcal{T}$  be a completed open tableau for A. Then U, the union of the labels of the nodes on an open branch, is a Hintikka set by Theorem 2.59 and a model can be found for U by Theorem 2.60. Since A is the formula labeling the root,  $A \in U$ , so the interpretation is a model of A.
