

1. Show the correctness of the following `max()`

```
/* max() should return a bigger value between a and b if a!=b.  
   If a==b, max() should return the value of b*/  
int max(int a, int b) {  
    int bigger=0;  
    if( a >= b +1) bigger = a;  
    else bigger= b;  
    return bigger;  
}
```

2.1 Write down a proper assert statement to check the correctness of `max()`

2.2 Transform `max()` into a SSA form.

2.3 Write down a corresponding QF_LIA specification and check the correctness by using a SMT solver

(note. you should show **validity**, not satisfiability for software verification)

2.4 Write down a corresponding QF_BV and check the correctness by using a SMT solver

2.5 Compare the result of 2.3 and 2.4. Why are the results different?

2. Transform the following sort program into QF_AUFLIA specification and check the correctness by using a SMT solver.

```
#define N 3
int main(){
    // local variables are initialized with random values
    int data[N], i, j, tmp;

    for (i=0; i<N-1; i++)
        for (j=i+1; j<N; j++)
            if (data[i] > data[j]){
                tmp = data[i];
                data[i] = data[j];
                data[j] = tmp;
            }
    assert(data[0] <= data[1] && data[1] <= data[2]);
}
```
