

Chapter 1

Software and Software Engineering

Moonzoo Kim
CS Division of EECS Dept.
KAIST

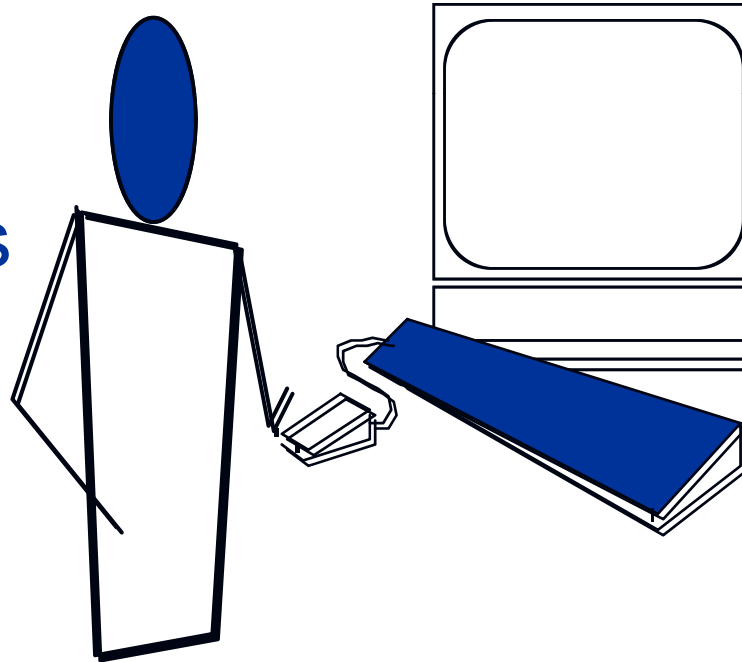

Software's Dual Role

- Software is a product
 - Delivers computing potential
 - Produces, manages, acquires, modifies, displays, or transmits **information**
- Software is a **vehicle** for delivering a product
 - Supports or directly provides system functionality
 - Controls other programs (e.g., an operating system)
 - Effects communications (e.g., networking software)
 - Helps build other software (e.g., software tools)

What is Software?

Software is a **set** of items or objects that form a “configuration” that includes

- programs
- documents
- data ...

What is Software?

- software is engineered
- software doesn't wear out
- software is complex

Wear vs. Deterioration

Legacy Software

Why must it change?

- software must be **adapted** to meet the needs of new computing environments or technology.
- software must be **enhanced** to implement new business requirements.
- software must be **extended to make it interoperable** with other more modern systems or databases.
- software must be **re-architected** to make it viable within a network environment.

Software Evolution (1/2)

- The Law of **Continuing Change** (1974):
 - E-type systems must be continually adapted
 - They become progressively less satisfactory otherwise
- The Law of **Increasing Complexity** (1974):
 - As an E-type system evolves, its complexity increases unless work is done to maintain or reduce it (refactoring)
- The Law of **Conservation of Organizational Stability** (1980):
 - The average effective global activity rate in an evolving E-type system is invariant over product lifetime.

Software Evolution (2/2)

- The Law of **Conservation of Familiarity** (1980):
 - As an E-type system evolves all associated with it, developers, sales personnel, users, for example, must maintain mastery of its content and behavior to achieve satisfactory evolution.
 - Therefore, the average incremental growth remains invariant as the system evolves
- The Law of **Continuing Growth** (1980):
 - The functional content of E-type systems must be continually increased to maintain user satisfaction over their lifetime.
- The Law of **Declining Quality** (1996):
 - The quality of E-type systems will appear to be declining unless they are rigorously maintained and adapted to operational environment changes.

Management Myths

- **Myth:** We already have standards and procedures for building software, won't that provide my people with everything they need to know?
 - **Reality:** The book of standards may very well exist, but is it used? In many cases, the answer to the following questions is "no."
 - Are software practitioners aware of its existence?
 - Does it reflect modern software engineering practice?
 - Is it complete?
 - Is it streamlined to improve time to delivery while still maintaining a focus on quality?
- **Myth:** If we get behind schedule, we can add more programmers and catch up
 - **Reality:** Software development is **not** a mechanistic process like manufacturing. In the words of Brooks [BRO75]: "adding people to a late software project makes it later"
- **Myth:** If I decide to outsource the software project to a third party, I can just relax and let that firm build it.
 - **Reality:** If an organization does not understand how to manage and control software projects internally, it will invariably struggle when it outsources software projects.

Customer Myths

- **Myth:** A general statement of objectives is sufficient to begin writing programs—we can fill in the details later.
 - **Reality:** A poor up-front definition is the major cause of failed software efforts. A **formal and detailed description** of the information domain, function, behavior, performance, interfaces, design constraints, and validation criteria is essential. These characteristics can be determined only after thorough **communication** between customer and developer.
- **Myth:** Project requirements continually change, but change can be easily accommodated because software is flexible.
 - **Reality:** It is true that software requirements change, but the impact of change varies with the time at which it is introduced.

Practitioner's Myths

- **Myth:** Once we write the program and get it to work, our job is done.
 - **Reality:** Someone once said that "the sooner you begin 'writing code', the longer it'll take you to get done." Industry data ([LIE80], [JON91], [PUT97]) indicate that between 60 and 80 percent of all effort expended on software will be expended after it is delivered to the customer for the first time.
- **Myth:** Until I get the program "running" I have no way of assessing its quality.
 - **Reality:** One of the most effective software quality assurance mechanisms can be applied from the inception of a project—the *formal technical review*. Software reviews are more effective than testing for finding certain classes of software defects.
- **Myth:** The only deliverable work product for a successful project is the working program.
 - **Reality:** A working program is only one part of a *software configuration* that includes many elements. **Documentation** provides a foundation for successful engineering and, more important, guidance for software support.
- **Myth:** Software engineering will make us create voluminous and unnecessary documentation and will invariably slow us down.
 - **Reality:** Software engineering is not about creating documents. It is about creating quality. Better quality leads to reduced rework. And reduced rework results in faster delivery times.

How a Project Starts (pg 48)

- **The scene:**
 - Meeting room at CPI Corporation, a (fictional) company that makes consumer products for home and commercial use.
- **The players:**
 - Mal Golden, senior manager, product development;
 - Lisa Perez, marketing manager;
 - Lee Warren, engineering manager;
 - Joe Camalleri, executive VP, business development.

The conversation:

- **Joe:** Okay, Lee, what's this I hear about your folks developing a what? A generic universal wireless box?
- **Lee:** It's pretty cool, about the size

of a small matchbook. We can attach it to sensors of all kinds, a digital camera, just about anything. Using the 802.11 b wireless protocol. It allows us to access the device's output without wires. We think it'll lead to a whole new generation of products.

- **Joe:** You agree, Mal?
- **Mal:** I do. In fact, with sales as flat as they've been this year, we need something new. Lisa and I have been doing a little market research, and we think we've got a line of products that could be big.
- **Joe:** How big... , bottom-line

- **Mal: (avoiding a direct commitment):** Tell him about our idea, Lisa.
- **Lisa:** It's a whole new generation of what we call "home management products." We call 'em *SafeHome*. They use the new wireless interface, provide homeowners or small business people with a system that's controlled by their PC--home security, home surveillance, appliance and device control. You know, turn down the home air conditioner while you're driving home, that sort of thing.
- **Lee: (jumping in)** Engineering's done a technical feasibility study of this idea, Joe. It's doable at low manufacturing cost. Most hardware is off the shelf. Software is an issue, but it's nothing that we can't do.
- **Joe:** Interesting. Now, I asked about the bottom line.
- **Mal:** PCs have penetrated 60 percent of all households in the USA. If we could price this thing right, it could be a killer-App. Nobody else has our wireless box--it's proprietary. We'll have a two-year jump on the competition. Revenue? Maybe as much as \$30-40 million in the second year.
- **Joe (smiling):** Let's take this to the next level. I'm interested.
