
Equivalence Semantics of CCS

Moonzoo Kim
CS Dept. KAIST

- Trace Equivalence
- Observational Trace Equivalence
- Bisimulation Equivalence
- Observational Bisimulation Equivalence
- Example
- Usage of Concurrent Workbench

Trace Equivalence

- Sys is a **design** for buffer with separated input/output ports

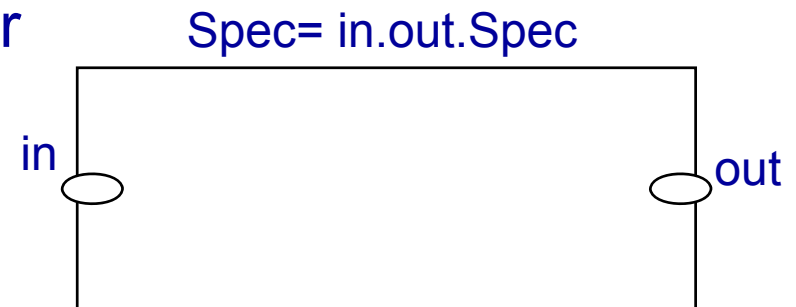

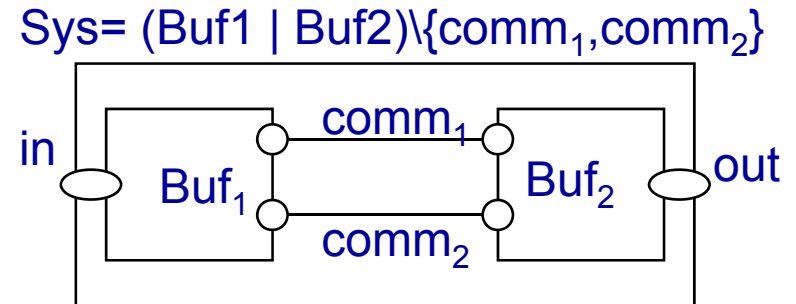

- ✦ $\text{Sys} = (\text{Buf}_1 \mid \text{Buf}_2) \setminus \{\text{comm}_1, \text{comm}_2\}$
 - $\text{Buf}_1 = \text{in}.\text{comm}_1'.\text{Buf}_1'$, $\text{Buf}_1' = \text{comm}_2.\text{Buf}_1$
 - $\text{Buf}_2 = \text{comm}_1.\text{Buf}_2'$, $\text{Buf}_2' = \text{out}.\text{comm}_2'.\text{Buf}_2$

- Spec is a **requirement** for the buffer design

- ✦ $\text{Spec} = \text{in}.\text{Spec}'$, $\text{Spec}' = \text{out}.\text{Spec}$

- Question: $\text{Sys} == \text{Spec}$?

- ✦ Let us consider **trace equivalence** (i.e. language equivalence) $=_T$
 - $T(P) = \{s \in \text{Act}^* \mid s \text{ is an execution trace of } P\}$
 - $P =_T Q$ iff $T(P) = T(Q)$

Observational Trace Equivalence

■ Sys =_T Spec?

✚ No. Sys has τ which Spec does not

- $T(\text{Sys}) = \{\text{in}, \text{in}.\tau, \text{in}.\tau.\text{out}', \text{in}.\tau.\text{out}'.\tau, \dots\}$
- $T(\text{Spec}) = \{\text{in}, \text{in}.\text{out}' \dots\}$

$$\begin{aligned} \text{Sys} &= (\text{Buf}_1 \mid \text{Buf}_2) \setminus \{\text{comm}_1, \text{comm}_2\} \\ \text{Buf}_1 &= \text{in}.\text{comm}_1.\text{Buf}_1', \quad \text{Buf}_1' = \\ &\text{comm}_2.\text{Buf}_1 \\ \text{Buf}_2 &= \\ &\text{comm}_1'.\text{Buf}_2', \text{Buf}_2' = \text{out}.\text{comm}_2'.\text{Buf}_2 \\ \text{Spec} &= \text{in}.\text{out}.\text{Spec} \end{aligned}$$

✚ Yes. τ is an internal hidden action **not visible outside (not observable)**.

Thus, τ should not be included in an execution

- If $s \in \text{Act}^*$, then $\hat{s} \in (\text{Act} - \{\tau\})^*$ is the action sequence obtained by deleting all occurrences of τ from s .
 - Ex> $s = a.\tau.b.\tau.c$, then $\hat{s} = a.b.c$
- A set of **observable** execution traces: $T'(P) = \{\hat{s} \mid s \in T(P)\}$
- $P =_{\text{OT}} Q$ iff $T'(P) = T'(Q)$
- $\text{Sys} =_{\text{OT}} \text{Spec}$ because $T'(\text{Sys}) = \{\text{in}, \text{in}.\text{out}', \dots\}$, $T'(\text{Spec}) = \{\text{in}, \text{in}.\text{out}', \dots\}$

Bisimulation Equivalence

■ $P =_{BS} Q$ iff for all $\alpha \in Act$

- ✦ Whenever $P \xrightarrow{\alpha} P'$, then for some Q' , $Q \xrightarrow{\alpha} Q'$ and $P' =_{BS} Q'$
- ✦ Whenever $Q \xrightarrow{\alpha} Q'$, then for some P' , $P \xrightarrow{\alpha} P'$ and $P' =_{BS} Q'$

■ Note

- ✦ $=_{BS}$ is an equivalence relation (reflexive, transitive, symmetric)
- ✦ $P =_{BS} Q$ implies $P =_T Q$, but **not vice versa**

■ Example>

- ✦ $C_0 = b'.C_1 + a.C_2$, $C_1 = a.C_3$, $C_2 = b'.C_3$, $C_3 = b'.C_1 + a.C_2$
- ✦ $D_0 = b'.D_1 + a.D_2$, $D_1 = a.D_0$, $D_2 = b'.D_0$
- ✦ A binary relation R proves that $C_0 =_{BS} D_0$
 - $R = \{(C_0, D_0), (C_1, D_1), (C_2, D_2), (C_3, D_0)\}$

Observational Bisimulation Equivalence

- We cannot simply ignore τ for observational bisimulation equivalence.

Thus, we define a new observational transition $=\alpha\Rightarrow$

- $P =_{OBS} Q$ iff for all $\alpha \in Act$

- ✦ Whenever $P =\alpha\Rightarrow P'$, then for some Q' , $Q =\alpha\Rightarrow Q'$ and $P' =_{OBS} Q'$

- ✦ Whenever $Q =\alpha\Rightarrow Q'$, then for some P' , $P =\alpha\Rightarrow P'$ and $P' =_{OBS} Q'$

- $P =\alpha\Rightarrow Q$ iff $P (-\tau\rightarrow)^* -\alpha\rightarrow (-\tau\rightarrow)^* Q$ where $\alpha \in Act - \{\tau\}$

- ✦ Let $s \in (Act - \{\tau\})^*$. Then $q =s\Rightarrow q'$ if there exists s' s.t. $q -s'\rightarrow q'$ and $s =\hat{s}'$

- ✦ $P = a.P + b.P$, $Q1 = a.Q1 + \tau.Q2$, $Q2 = b.Q1$

- Suppose that 'a' means pushing button 'a'. Similarly for 'b'

- P always allows a user to push any buttons.

- Q1 allows a user to push button 'a' sometimes, button 'b' sometimes.

- Thus, we need to distinguish P from Q1 (P and Q1 are **not observationally bisimilar**), which can be done using $=\alpha\Rightarrow$ instead of $-\alpha\rightarrow$

- $Q1 -a\rightarrow Q1$ implies $Q1 =a\Rightarrow Q1$. Similarly $Q2 -b\rightarrow Q1$ implies $Q2 =b\Rightarrow Q1$

- $Q1 -a\rightarrow Q1 -\tau\rightarrow Q2$ implies $Q1 =a\Rightarrow Q2$. $Q2 -b\rightarrow Q1 -\tau\rightarrow Q2$ implies $Q2 =b\Rightarrow Q2$

Observational Bisimulation Equivalence (cont)

■ $\text{Sys} =_{\text{BS}} \text{Spec}$? (see slide 3)

- ✚ No. Sys has τ which Spec does not (i.e. not strongly bisimilar)

■ $\text{Sys} =_{\text{OBS}} \text{Spec}$?

- ✚ Yes. Sys is **observationally bismilar** to Spec

- Proof: $R = \{ (s0, \text{Spec}), (s1, \text{Spec}'), (s3, \text{Spec}), (s2, \text{Spec}') \}$
 - $s0 \text{--in-->} s1$ implies $s0 = \text{in} \Rightarrow s1$. Similarly, $s2 \text{--out-->} s3$ implies $s2 = \text{out} \Rightarrow s3$
 - $s0 \text{--in-->} s1 \text{--}\tau\text{-->} s2$ implies $s0 = \text{in} \Rightarrow s2$.
 - $s2 \text{--out-->} s3 \text{--}\tau\text{-->} s0$ implies $s2 = \text{out} \Rightarrow s0$
